

MANUFACTURING

GRAEME SNOOKS

MANUFACTURING HAS PLAYED a central role in the development of the Australian economy during the last century. As a major source of employment, manufacturing facilitated high rates of immigration at a time when Australian rural export industries were actually shedding labour. The aim of government policies after World War I to increase the size of the Australian population could not have been achieved without the development of manufacturing under a protective tariff umbrella. Because tariff protection in the interwar years involved a relative shift of resources from high productivity rural industries to lower productivity urban industries, the federal government unwittingly ensured a slower rate of growth of living standards in its quest for the desired increase in community size. Yet in the longer term this policy was effective. The larger population enabled the achievement of economies of scale in the manufacturing sector after World War II, which in turn helped to raise productivity levels. From the late 1940s, therefore, the Australian manufacturing sector was able to absorb a rapidly growing population and to contribute to substantial improvements in average living standards.

A statistical outline of the development of the manufacturing sector between 1860 and 1982 has been provided in this chapter largely through employment data. The reasons for this focus are two-fold. Firstly, most people view economic activity primarily in terms of the employment it provides, and, secondly, employment can be interpreted without making complicated or questionable adjustments, such as price deflation. Yet, to round out this statistical portrait, additional data have also been provided on investment in plant and machinery, capital stock, and value of production, or value added. With these final three tables, and the output prices presented elsewhere in this volume, the interested reader can calculate capital-labour ratios, together with indexes of both labour and total-factor productivity.

The data clearly show that expansion of manufacturing was rapid throughout this period, although it did vary in a cyclical pattern: between 1868 and 1901 employment increased by 8.3 times; from Federation to the Great Depression, by 3 times; from the late 1920s to the late 1940s, by 1.8 times; and between then and the peak level achieved, in 1974, there was a 1.7 fold increase. Since the mid-1970s, however, employment has declined slightly in absolute terms. As this expansion was more rapid than the economy as a whole, the relative importance of the manufacturing sector increased substantially, if unevenly, throughout this period. Manufacturing

employment as a percentage of the total workforce surged ahead during three relatively short periods: the 1870s, when it increased from 3.1 to 10.7; from Federation to World War I, when it increased to 16.0; and during World War II when it increased to 24.7, an unprecedented level.

These surges in the relative importance of the manufacturing sector coincided with periods of significant structural change, which were produced by shifts of activity from the traditional areas of food processing, wood working and clothing to the more industrially advanced areas of metals and engineering, and chemicals. For example, employment in the metals and engineering industry as a proportion of total manufacturing employment, increased from 18 per cent in 1871, to 47.6 per cent in 1968, after which it declined slightly to 43.9 per cent in 1982. The main expansion of this sector, therefore, occurred after the late 1930s, and appears to have been central to Australia's industrialisation process. Corresponding with the expansion of metals and engineering, was a decline in the relative importance of food processing (from 20.8 per cent in 1871 to 11.0 per cent in 1968), wood working (13.2 to 6.5 per cent) and clothing and textiles manufacture (23.0 to 14.1 per cent).

The expansion and structural change of manufacturing after World War II was associated with a rapid growth of productivity. Excluding the years of the Great Depression, growth of manufacturing output per employee from Federation to World War II varied from 1.0 to 1.3 per cent per annum, whereas during the 1950s and 1960s it rose dramatically to 4.1 per cent per annum. During these two decades the expansion of manufacturing productivity per annum was 10.8 per cent higher than in the agricultural sector and almost double that of the economy as a whole. For the first time absolute levels of labour productivity in manufacturing became comparable with those in agriculture, which enabled industrial expansion to be achieved without adversely affecting the growth of GDP per capita. Unfortunately the improved productivity performance could not be sustained, and it fell to 2.4 per cent per annum between 1970 and 1982.

Regional changes in manufacturing have been important. In 1982, as in 1871, New South Wales and Victoria employed 71 per cent of the manufacturing workforce, with the other four states employing the remaining 29 per cent. This statistical summary, however, obscures a number of significant regional changes. For example, while in 1871 Victoria's share of total manufacturing employment was 37 per cent and New South Wales was 34 per cent, this relationship was exactly reversed in 1982. Furthermore, the struggle for industrial leadership was not achieved gradually: New South Wales, which first took the lead from Victoria even before World War I, continued to forge ahead until by 1947 its share was as high as 45.2 per cent compared with Victoria's 33.1 per cent; since that time the gap has narrowed. Of the other states, Tasmania's share of total manufacturing employment declined steadily (from 8.2 to 2.2 per cent), Western Australia's increased steadily (1.4 to 6.1 per cent), South Australia's was fairly constant (8 to 9 per cent), and Queensland's fluctuated considerably before the Great Depression (as low as 5.9 in 1881 and as high as 16.2 per cent in 1899), but has been reasonably constant (9 to 10 per cent) since that time.

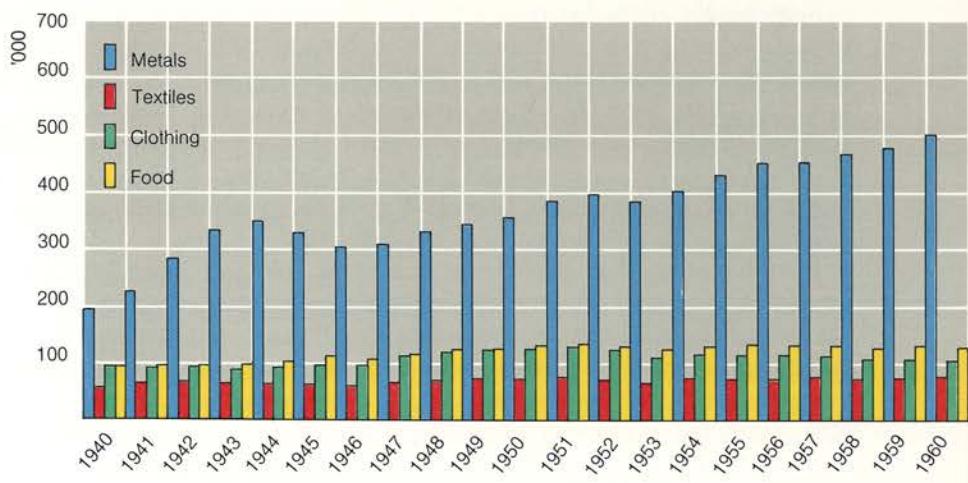

Surprisingly, there has been no major change in the relative contribution of women to the manufacturing sector in the twentieth century: in 1901 females constituted 21.8 per cent of the manufacturing workforce, and in 1982 a slightly greater 25.3 per cent (a level reached as early as 1913). There were, however, a number of interesting fluctuations around this trend, which achieved modest peaks during World War I (27.6 per cent), the Great Depression (28.1 per cent), World War II (30 per cent), and 1974 (27.6 per cent). Clearly, the increased workforce participation of women since World War II has resulted from growing employment opportunities in the service and professional industries.

Manufacturing has played an important role in Australia's past development, largely through a process of government-assisted import replacement. Now that expansion of this type has been fully exploited, manufacturing will only continue to expand rapidly if it is able to initiate and sustain a process of innovation that will enable Australian firms to make significant and growing inroads into export markets. Unless this can be achieved, and past performance gives little cause for optimism, the role of manufacturing as an important agent of economic development will have been played out.

NOTE Prices are constant 1939 prices. In 1969 census units underwent major redefinition.

The present costs of protection are dangerously high . . . It cannot be too strongly emphasized that only by improved efficiency and consequent reduction in prices in the industries now protected can resources be set free for protecting new industries'

The Australian Tariff Enquiry, 1929.

NOTE Prices are current prices. In 1969 census units underwent major redefinition.

Frank Hinder, Painting 1946, tempera on hardboard.

Hinder was attracted to complex modern life subjects involving movement, and much of his work during the period 1943 to 1951 featured shapes such as squares, rectangles, triangles and circles.
